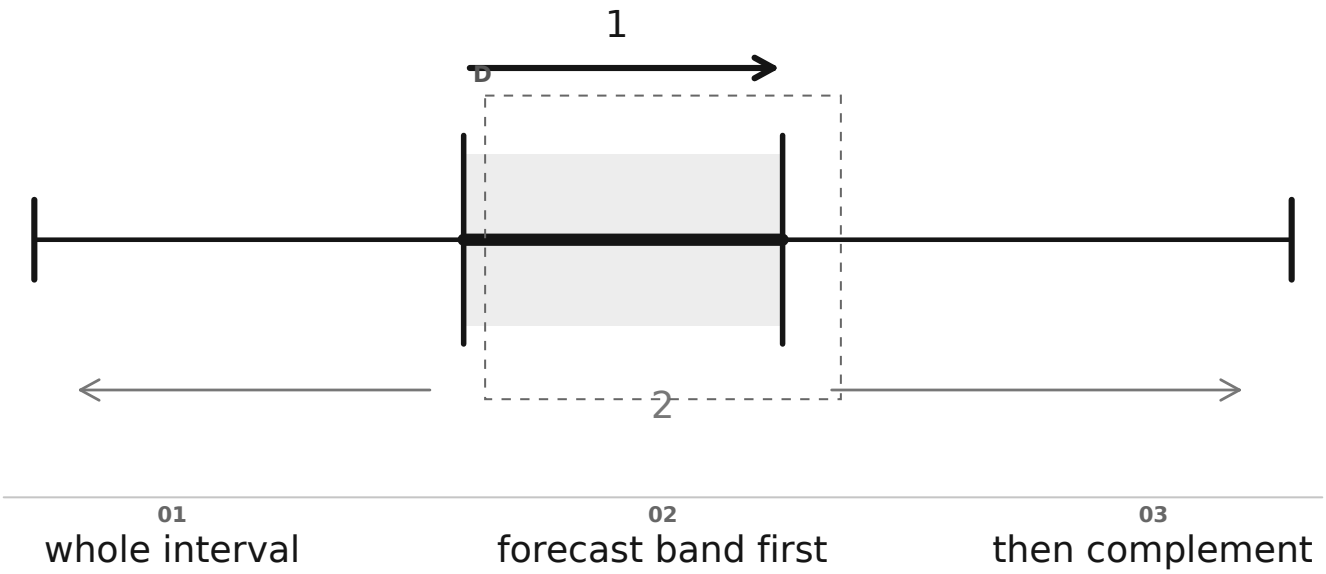
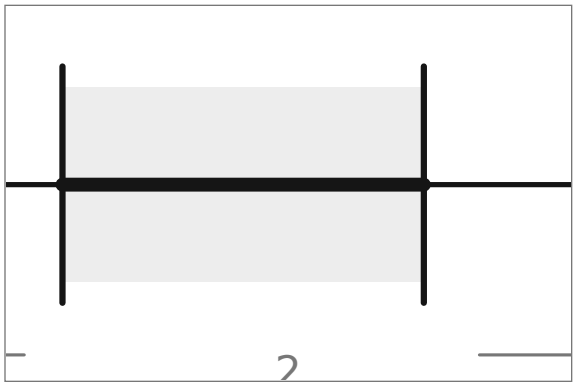
M013

FUSED priority-band traversal with fallback



D / OPERATION DETAIL



Vector detail / 1.13× main-view scale

HOW THE OPERATION WORKS

Search a forecast band first, then its complement. This can improve order under a good predictor without permanently excluding any key.

READ THE THREE STAGES

01 whole interval
02 forecast band first
03 then complement

WHAT WAS ACTUALLY DONE

The fixed-budget educational comparison used affine permutations within the band and fallback regions. It checked bounded prefixes, not every integer in the forecast band.

ORIGINAL FINDING / EXECUTED RECORD

Fixed-budget test retained complementary regions; 286,720 checks across both methods found no keys.
