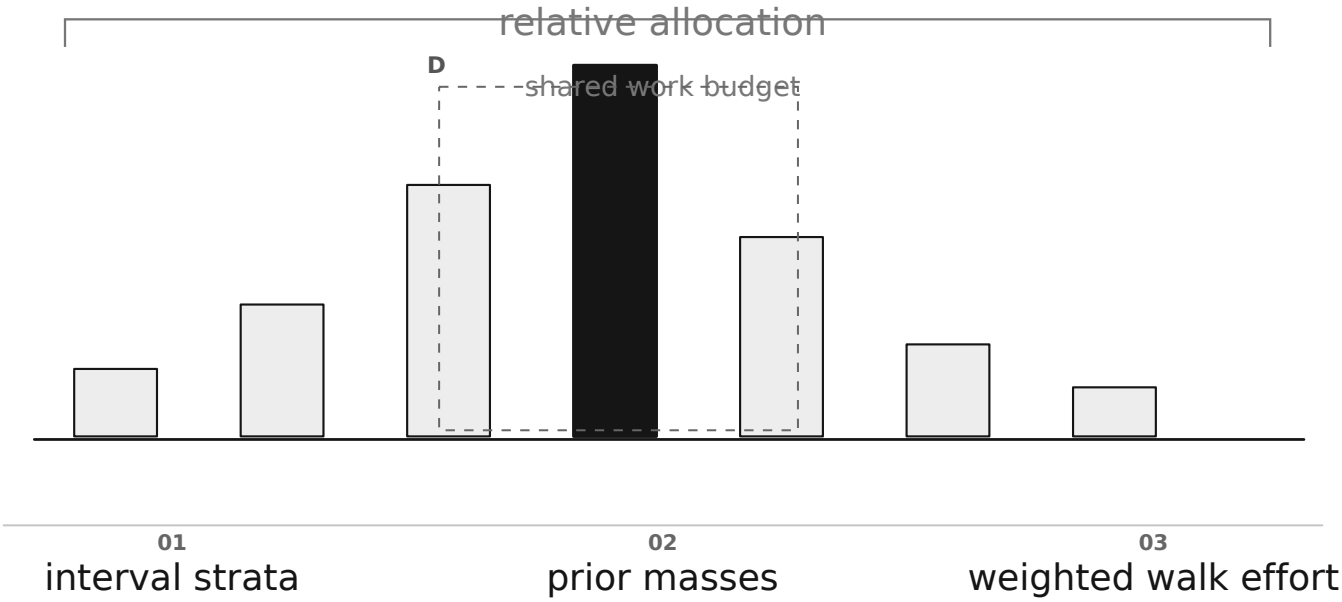
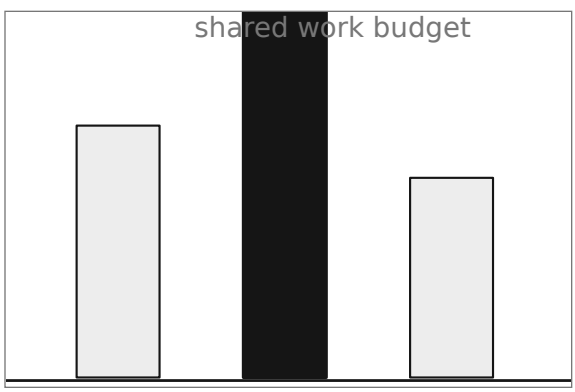
M029

Prior-weighted stratified kangaroo



D / OPERATION DETAIL



Vector detail / 1.00× main-view scale

HOW THE OPERATION WORKS

Split a known-point interval into strata and allocate more tame-walk effort where a supplied prior assigns greater probability.

READ THE THREE STAGES

01 interval strata
02 prior masses
03 weighted walk effort

WHAT WAS ACTUALLY DONE

pwsk.py builds a smoothed histogram, assigns budgets using prior mass and width, and searches against a shared wild herd. Its benefit depends on the supplied prior actually predicting targets.

ORIGINAL FINDING / IMPLEMENTED

Reweights interval effort when a genuine prior exists; flat priors reduce to ordinary allocation. Prior quality is unestablished for the unknown puzzle.
