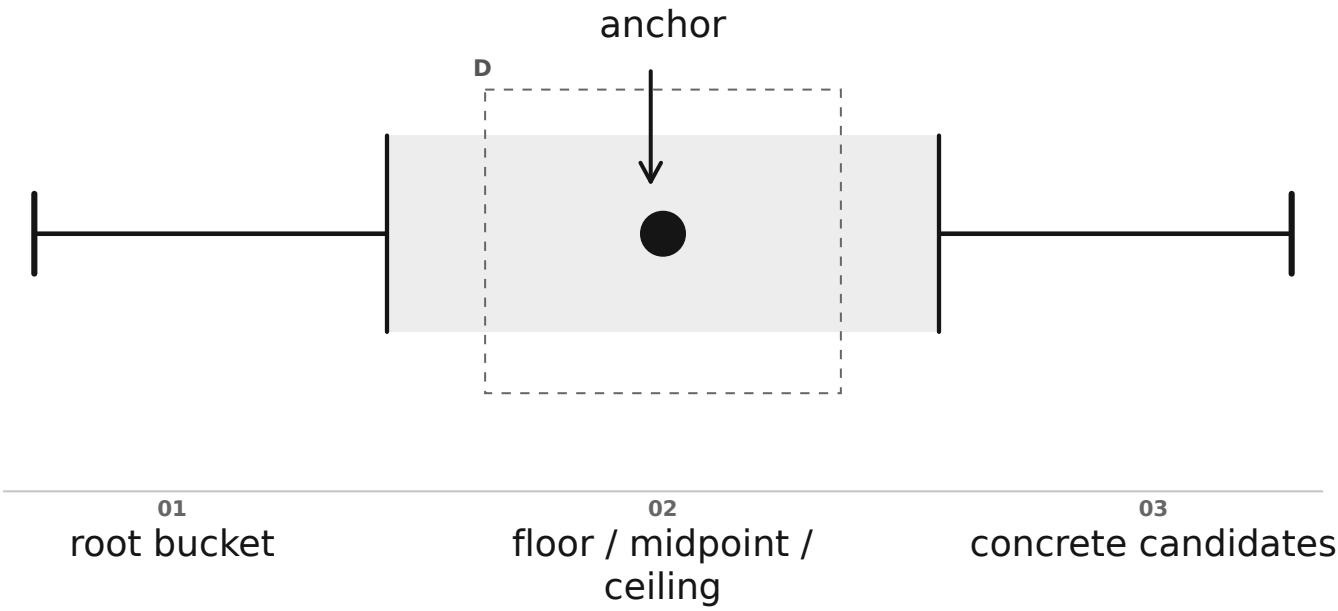
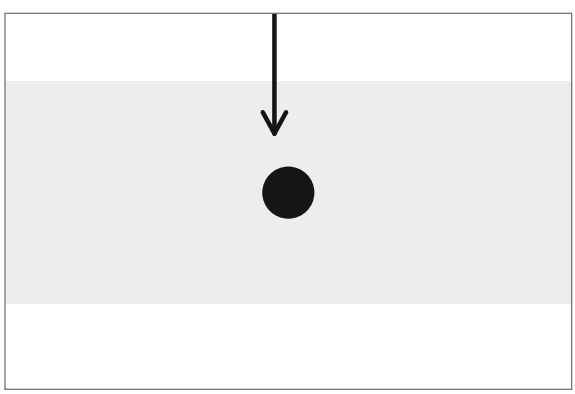
M072

Root floor/midpoint/ceiling candidate anchors



D / OPERATION DETAIL



Vector detail / 1.13× main-view scale

HOW THE OPERATION WORKS

Turn plausible root locations into concrete integers using floors, midpoints, ceilings or differences from disclosed roots.

READ THE THREE STAGES

01 root bucket
02 floor / midpoint / ceiling
03 concrete candidates

WHAT WAS ACTUALLY DONE

The root-test engine builds a fixed catalog of anchor candidates without reading the target key. Each resulting scalar is checked against that target's actual HASH160.

ORIGINAL FINDING / EXECUTED RECORD

Fixed root-band and root-difference candidate families checked against known and unknown targets.
