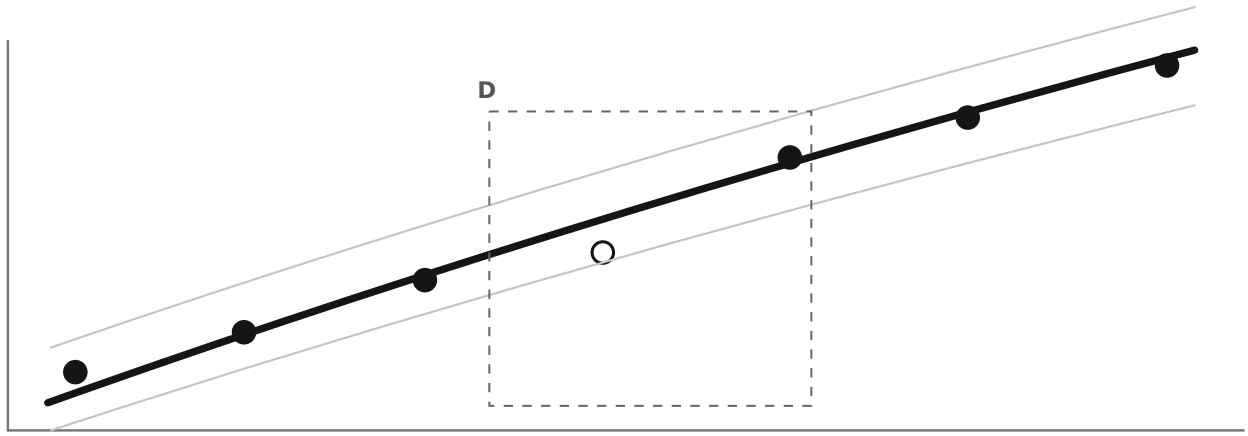
M076

Smooth polynomial share in puzzle index

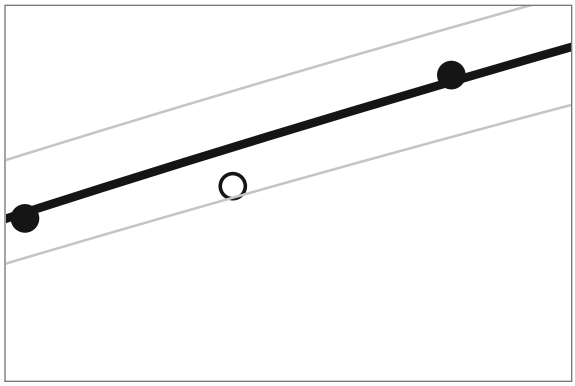


01 bucket shares

02 polynomial in index

03 predicted share

D / OPERATION DETAIL



Vector detail / 1.17× main-view scale

HOW THE OPERATION WORKS

Assume normalized bucket share is a low-degree polynomial in puzzle index and use fitted values to generate target offsets.

READ THE THREE STAGES

01 bucket shares
02 polynomial in index
03 predicted share

WHAT WAS ACTUALLY DONE

smooth_share.py fits degrees 1-4, evaluates errors against a uniform-share baseline and checks candidates over legal target roots. Numerical fit quality is reported separately from address hits.

ORIGINAL FINDING / EXECUTED RECORD

Degrees 1-4 predict bucket shares; saved per-degree unknown-target tests report no matches.
