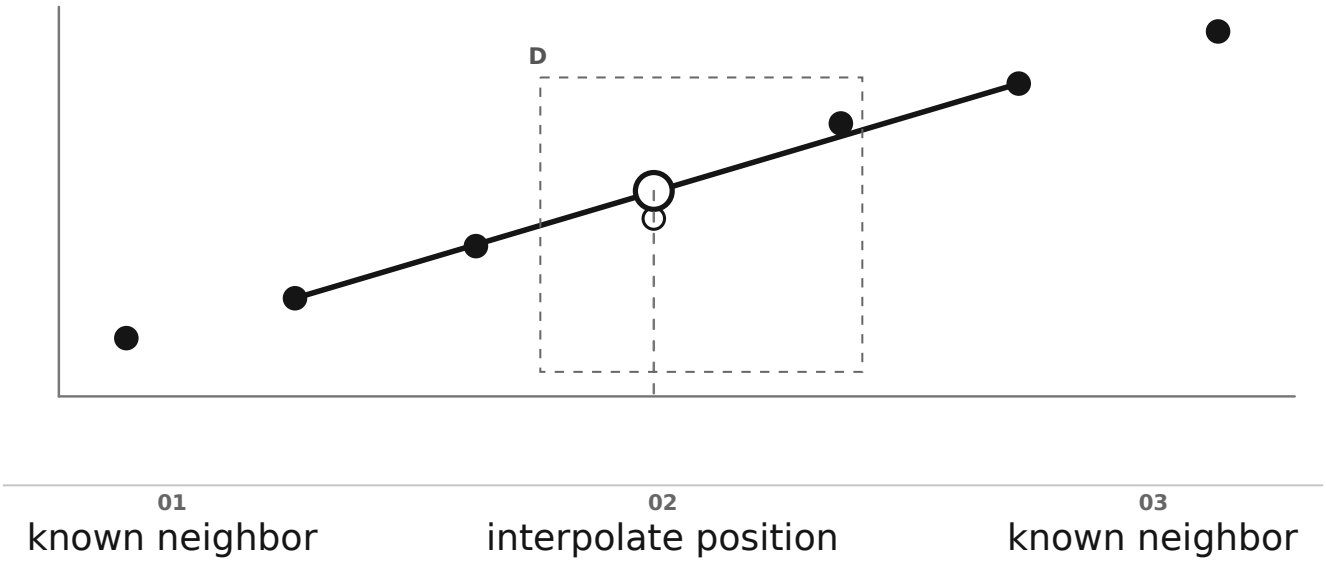
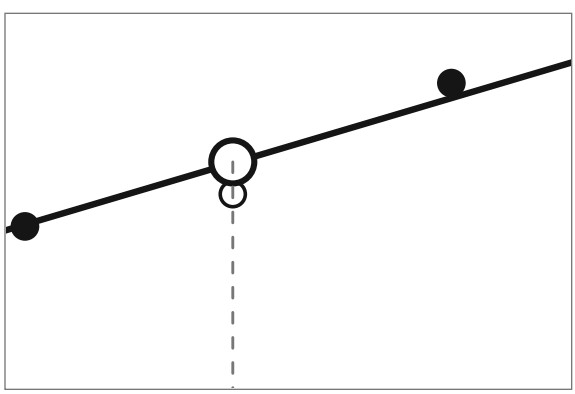
M078

Gap-fill normalized-position interpolation



D / OPERATION DETAIL



Vector detail / 1.17× main-view scale

HOW THE OPERATION WORKS

Assume normalized interval position changes smoothly between the nearest disclosed neighbors. Interpolate that position into the target interval.

READ THE THREE STAGES

01 known neighbor
02 interpolate position
03 known neighbor

WHAT WAS ACTUALLY DONE

gap_fill.py creates one or more exact integer candidates from those neighboring positions. The hypothesis is smoothness; the verifier, not visual continuity, determines success.

ORIGINAL FINDING / EXECUTED RECORD

Interpolate/extrapolate between disclosed neighboring puzzles and verify candidates; no recorded matches.
