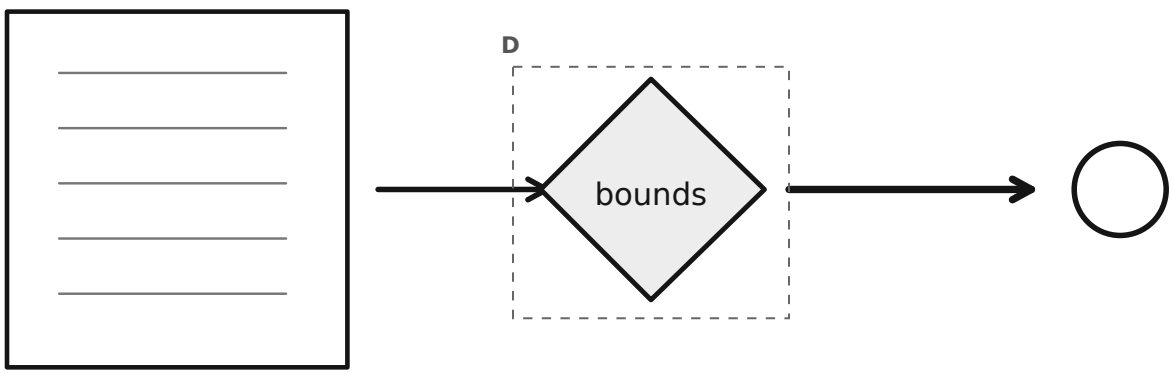
Frozen candidate families on 77 unknown targets

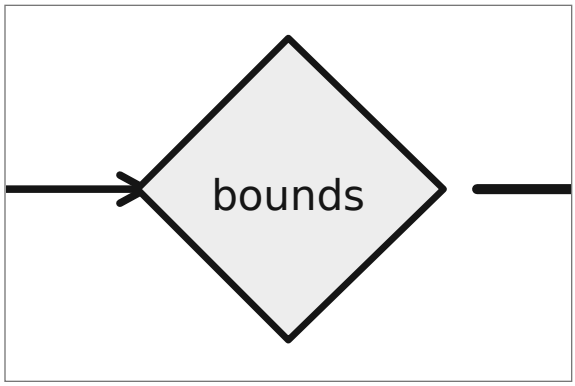


01
frozen families

02
77 unknown targets

03
bounded checks

D / OPERATION DETAIL



Vector detail / 1.37× main-view scale

HOW THE OPERATION WORKS

Freeze a finite candidate recipe, apply it to every locally undisclosed puzzle, and compare each output with that puzzle's target hash.

READ THE THREE STAGES

01 frozen families
02 77 unknown targets
03 bounded checks

WHAT WAS ACTUALLY DONE

all_unknown_check.py evaluates 77 database entries and saves candidate/target counts. A completed finite recipe search is not an exhaustive search of all their intervals.

ORIGINAL FINDING / EXECUTED RECORD

Local all-unknown report records 2,744 distinct candidate/target checks and no matches.
