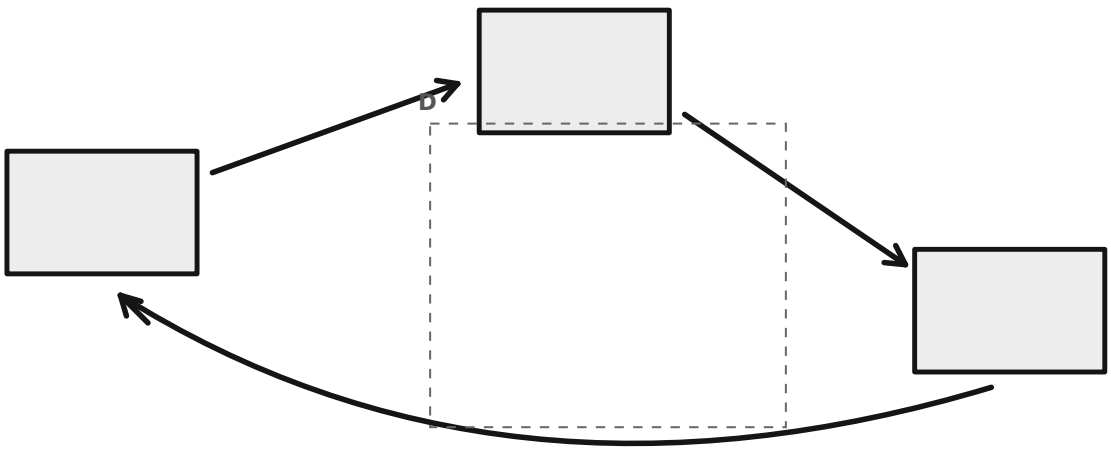
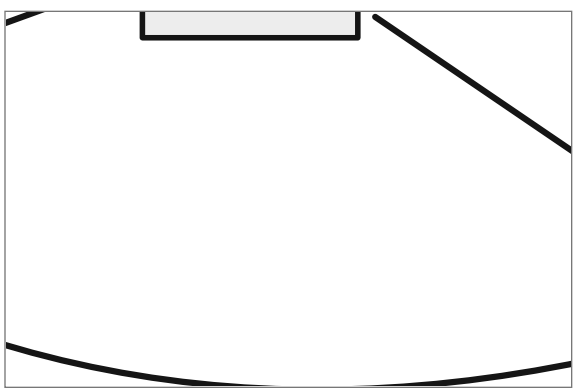
M218

Adaptive Shor simulation trial budgets



D / OPERATION DETAIL



Vector detail / 1.13× main-view scale

HOW THE OPERATION WORKS

Measure trial success, compute a confidence-aware required budget and adjust the number of repetitions to meet a target.

READ THE THREE STAGES

01 trial outcomes
02 estimate success rate
03 adapt repetition budget

WHAT WAS ACTUALLY DONE

The factoring loop changes trial counts and ramps a bounded test size. The feedback improves a classical experimental procedure, not the underlying cryptographic problem's entropy.

ORIGINAL FINDING / EXECUTED RECORD

Empirical/analysis/improvement loop adjusts trial counts with Wilson-bound and runtime metrics.
