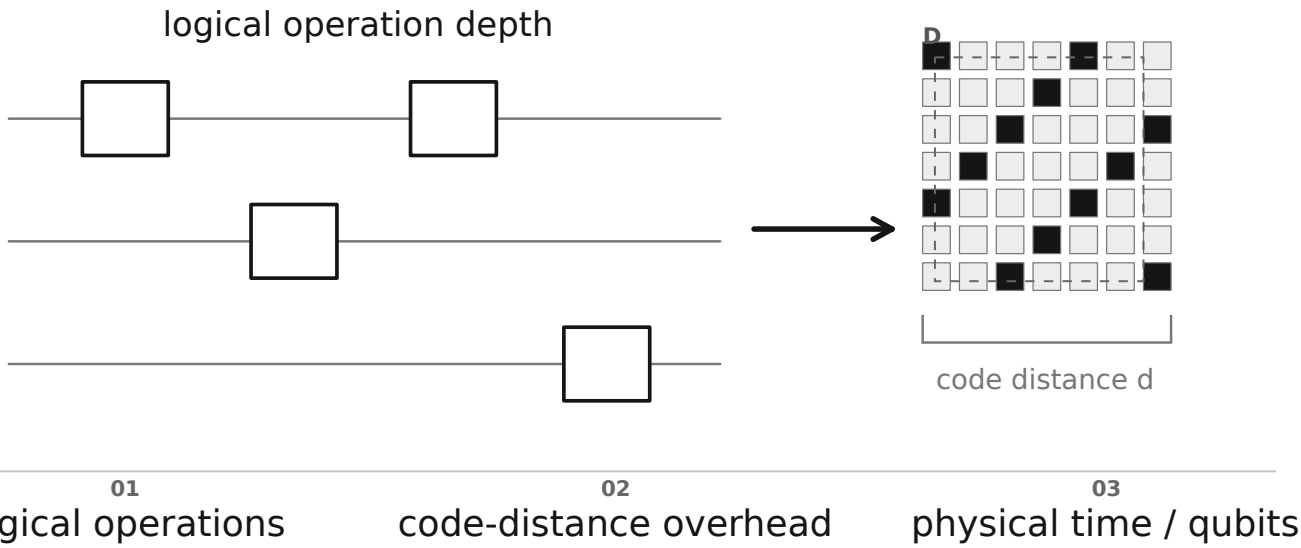
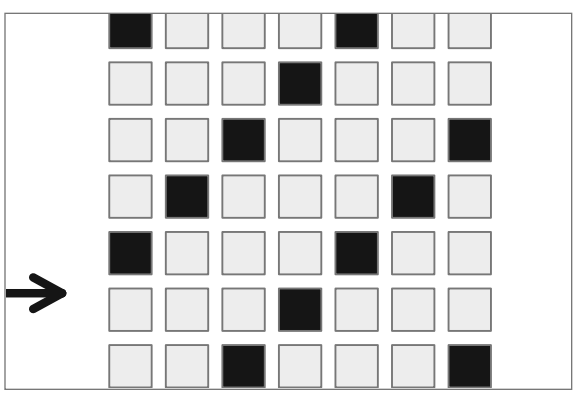
M223

Surface-code/platform timing estimates



D / OPERATION DETAIL



Vector detail / 1.54× main-view scale

HOW THE OPERATION WORKS

Map logical operation counts to physical qubits and runtime using code distance, gate/cycle assumptions and platform parameters.

READ THE THREE STAGES

01 logical operations
02 code-distance overhead
03 physical time / qubits

WHAT WAS ACTUALLY DONE

quantum.py calculates resource estimates for chosen profiles. The outputs are model-dependent arithmetic, not measured throughput on an available quantum computer.

ORIGINAL FINDING / IMPLEMENTED/MODEL

Compare physical errors, distances and cycle times for several platforms; estimates depend on explicit architecture assumptions.
